The field of occupational health and safety constantly changes, especially as it pertains to biomedical research. New infectious hazards are of particular importance at nonhuman-primate facilities. For example, the discovery that B virus can be transmitted via a splash on a mucous membrane raises new concerns that occupational health and safety approaches to prevent infection in import quarantine facilities in the U.S. The risk of such infectious hazards is best managed through a flexible and comprehensive Occupational Health and Safety Program (OHP) that can identify and mitigate potential hazards. Occupational Health and Safety in the Care and Use of Nonhuman Primates is intended as a reference for vivarium managers, veterinarians, researchers, safety professionals, and others who are involved in developing or implementing an OHP that deals with nonhuman primates. The book lists the important features of an OHP and provides the tools necessary for informed decision-making in developing an optimal program that meets all particular institutional needs.

Ocular infections remain an important cause of ocular morbidity and loss of vision, yet many are preventable or curable. Early diagnosis and prompt treatment help in the control of such infectious disorders and the prevention of blindness. This book provides the practitioner with the important information required to ensure appropriate diagnosis and management of ocular infectious diseases. Specific clinical signs and symptoms are outlined, and the role of specific diagnostic tests, including molecular biology techniques, is explained. All of the most common microorganisms are considered and current knowledge on the antimicrobial therapy of ocular infections is clearly summarized. Ocular infections will be a great help to physicians as a guide to the care of patients with ocular infections, and avoid unnecessary costs.

African and South American trypanosomiasis are notable features of clinical and veterinary practice in their respective endemic areas and, as such, are of considerable economic importance. Scientifically, however, their importance ex tends beyond their clinical significance, as the trypano somes are intriguing and easily manipulated models for the study of the control of gene expression, membrane chemistry, proliferation and differentiation. It is clear from the progress that the rate of advance has "hotter" up in these areas of trypanosome research over the past 5 years and so a single-topic volume within the scope of the present series seemed timely. As ever, the final admix ture of review topics was a compromise between what was appropriate and what was available - fortunately with the former in vast excess. I should like to highlight two omissions, made for an entirely different reasons. The first is a detailed treatment of the molecular biology of the variant surface glycopro teins of the African trypanosomes (in particular Trypano soma brucei and T. equiperdum). This topic has been the subject of several reviews, for example, BORST and CROSS (1982)1 and TURNER (1982)2, and so was excluded from the present volume. The second omission is a review of the first-class work on genetic recombination from the group of Dr. Leo Jenni at the Schweizerisches Tropeninstit ut, Basel. This group has used isoenzyme markers to show that T.
