Pediatric trauma continues to have a significant impact on the health and well-being of children in the United States. Trauma continues to be the leading cause of death in children 1 to 18 years of age and accounted for more than 14,000 deaths among all children 0 to 18 years of age. In 2008, there were more than 6.6 million nonfatal injuries among newborn to 18-year-olds, with an injury rate of greater than 1 in 10. There is little debate that a coordinated effort and pediatric-specific advances in pediatric trauma systems, prehospital care and hospital care, and injury prevention can have a positive impact on pediatric trauma outcomes in the United States. However, there are still gaps in access to centers that deliver pediatric-focused trauma care, especially in rural areas. Furthermore, there are differing views between different centers regarding the optimal approach to the initial evaluation and management of the pediatric trauma patient. This book is targeted to review critical aspects of the care of the pediatric trauma patient, highlighting the most common and critical injuries encountered in the acute care setting.

This fully revised Second Edition offers a complete review for the USMLE Step 2 Clinical Skills (CS) exam. It covers all diseases encountered on the exam and prepares students to interact with patients, take a good medical history, perform a focused physical examination, develop a workup plan, and write an organized patient note. Numerous sample cases and patient notes are included. This edition has new chapters on ethics in primary care; Step 2 cases and medical notes; and trauma medical notes. A new chapter format and design highlights essential information: chief complaint, questions to ask, key points, and workup plan.

When the first edition of Pediatric Psychopharmacology was published in 2002, it filled a void in child and adolescent psychiatry and quickly establishing itself as the definitive text/reference in pediatric psychopharmacology. While numerous short, clinically focused paperback books have been published since then, no competitors with the scholarly breadth, depth, and luster of this volume have emerged. In the second edition, Christopher Kratochvil, MD, a highly respected expert in pediatric psychopharmacology, joins the outstanding editorial team led by Dr. Martin and Dr. Saehall. In the new edition, the editors streamline the flow of information to reflect the growth in scientific data since the first edition appeared. The overall structure of the book remains the same, with major sections on underlying biology; somatic interventions; assessment and treatment; and special considerations.

Optimal care of children with neurocritical illness often involves multi-specialty collaboration, and recent years have seen a substantial expansion in the availability of data to guide acute care. This book addresses overall approaches to children with neurocritical illness and the management of specific conditions. It offers up-to-date, concise, and clinically relevant guidance to clinicians providing acute care to children with neurologic disorders. Reflecting the spectrum of specialties involved in pediatric neurocritical care, contributors are drawn from the fields of critical care medicine, neurology, neurosurgery, rehabilitation medicine, and many affiliated specialties. The chapters in this book are authored by experts in each individual topic, and co-edited by a neurologist and intensivist to ensure all topics have been fully addressed from both perspectives. The initial chapters focus on assessment and management of common conditions such as coma, headache, and elevated intracranial pressure. The middle chapters cover assessment and management of specific conditions including traumatic brain injury, demyelinating disorders, stroke subtypes, central nervous system disorders, and more. The final chapters of the book address ethical and psychological aspects of acute neurocritical illness. The complete continuum of care is discussed, from assessment, monitoring, and condition-specific management of specific problems through rehabilitation and end of life considerations.

Clinical Manual of Pediatric Consultation-Liaison Psychiatry offers a comprehensive guide for mental health clinicians, trainees, and students to pediatric consultation-liaison psychiatry (CLP), a specialized area of psychiatry whose practitioners have particular expertise in the diagnosis and management of psychiatric disorders in complex physically ill children and adolescents. Patients commonly fall into one of three descriptive categories: those with comorbid emotional and physical illnesses that complicate each other's management; those with distressing somatic symptoms plus abnormal thoughts, feelings, and behavior in response to these symptoms; and those with psychiatric symptoms that are a direct consequence of a physical illness and/or its treatment. The text, authored by two luminaries in pediatric psychiatry, thoroughly explores the challenges faced by these patients and pediatric practitioners and mental health professionals who together care for them, addressing, in a concrete and practical manner, the wide variety of issues encountered in the pediatric hospital. These concerns range from how to address treatment nonadherence in children to how to conduct a psychosocial assessment of a solid organ transplant recipient. The text's carefully chosen features and valuable content include: Historical context for the evolution of "pediatric psychosomatic medicine" to "pediatric consultation-liaison psychiatry," ensuring an accurate, up-to-date representation of the field and proper integration with DSM-5 classification. Detailed clinical assessment protocols, with guidance for exploring interrelated domains such as illness factors, emotional impact, family functioning, and social relationships. These practical, step-by-step guides assist the consultant in conducting a comprehensive psychiatric/psychological assessment. A target symptom-oriented chapter on psychopharmacology in the physically ill child, which offers guidance on management of acute agitation, insomnia, fatigue, depression, and anxiety. The treatment algorithms presented are designed to be easily understood by non-psychiatric clinicians. Guidance on the use of practical interventions to help physically ill children undergoing traumatic medical procedures, including hypnosis, progressive muscle relaxation, and breathing techniques. These specific techniques will help the clinician in assisting distressed patients. The previous edition was considered the gold standard for books in the field. This new, thoroughly revised iteration of Clinical Manual of Pediatric Consultation-Liaison Psychiatry will doubtless inspire similar acclaim for its rigor, accessibility, and clinical wisdom.
