Inhaltsangabe:Abstract: This paper aims at explaining the phenomenon of price anomalies between dual-class shares of companies located in mainland China (hereafter China). A-shares listed on either the Shanghai Stock Exchange (SHSE) or Shenzhen Stock Exchange (SZSE) command a premium over the price of the corresponding firm s H-shares traded at the Stock Exchange of Hong Kong (HKSE). This pricing puzzle arises from the segmentation of Chinese equity markets H-shares may be exclusively acquired by Hong Kong residents and international investors whereas A-shares are restricted to mainland Chinese investors. Although both classes of stock are entitled to the same future cash flows, investors are only willing to buy H-shares at a price significantly lower than that of A-shares. This unique setup offers the opportunity to test competing theories about the effects of market segmentation on asset pricing and to examine the factors that induce the price gap between cross-listed shares on different stock exchanges. Knowledge of the variables determining the price spread between H- and A-shares can make valuable contributions in a number of ways. Firstly, companies in mainland China pursuing initial public offerings (IPO) or seasoned equity offerings (SEO) may base their financing decision on a more thorough understanding of the parameters affecting stock prices of cross-listings in the respective markets. Secondly, policymakers in emerging country stock markets may draw conclusions concerning the design of foreign ownership regulation and investment restraints imposed on domestic and foreign investors. Lastly, international and local investors may build on a more profound understanding of the H- versus A-share discount (hereafter H-share discount) to narrow down attractive investment opportunity sets, especially in the light of the latest regulatory changes on the Chinese equity market. As of August 2007 the government body monitoring and regulating the national currency, China s State Administration of Foreign Exchange (SAFE), loosened its rigorous foreign exchange policy. Prior to the recent SAFE ruling, the annual amount to be freely converted from Chinese Yuan Renminbi (RMB) into foreign currencies was capped at a 50,000 United States Dollar (USD) limit. Under the new regime, mainland retail investors are granted unlimited convertibility of RMB into Hong Kong Dollar (HKD) given that investments flow into the Hong Kong securities market. In the [...]

Liferay Portal is the leading open-source enterprise portal framework that uses Java and Web 2.0 technologies. Web portals often function as a point of access to information on the World Wide Web. Web portals, such as Yahoo!, present information from diverse sources in a unified way. Aside from the search engine standard, web portals offer other services such as e-mail, news, stock prices, infotainment, and various other features. Portals provide a means for enterprises to supply a consistent look and feel with access control and procedures for multiple applications that otherwise would have been separate entities altogether. So, how do developers bring existing applications, as well as integrate content management systems and search engines, into a portal? And how do developers get started with the Liferay Portal engine? In Practical Liferay: Java-based Portal Applications Development, Dr. Poornachandra Sarang answers these questions and more. This book is for those who want to learn how to use Liferay to develop vertical or company-specific web portals and beyond. The book will serve as a practical guide to learning Liferay and developing real-world web portals.

Based on a 'free of survivorship-bias' sample of German stocks listed at the Frankfurt stock exchange, the study investigates the ability of hedge portfolio formation structures, built of three value premium proxies (P/B, P/E, and DY), the size factor, and the technical momentum factor, to generate excess returns in the period 1992 to 2011. First, the author characterizes and defines the significant terms that are in connection with value and growth investing. He continues with the discussion of asset pricing with the CAPM, the Fama and French three-factor model, and the Carhart extension, and then describes the expected stock returns that are of capital importance. Moreover, the author deals with related studies for the German stock market. He gives a detailed description of the empirical analysis before he draws his conclusions. The author's purpose is to answer the following core questions: Is there a value premium in the German market between 1992 and 2011? Is there a reversed size premium like recent empirical findings suggest? Do high momentum stocks perform better than low momentum stocks? Is there a significant seasonal pattern in hedge portfolio returns? The combination of which factors best explains expected stock returns?
